

1. The web site asked for a file upload with the following information: Ride ID, Rider name, pickup location, pickup time, and destination. This information will allow optimal routes to be calculated.

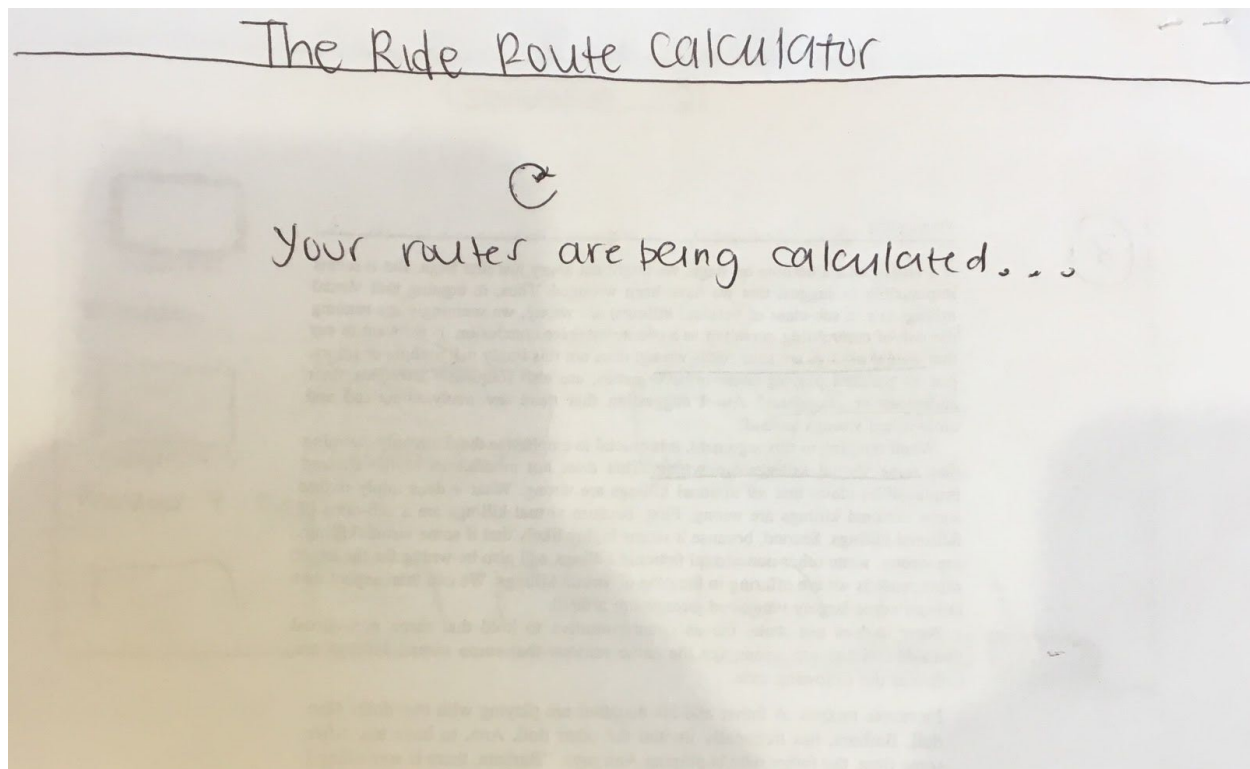

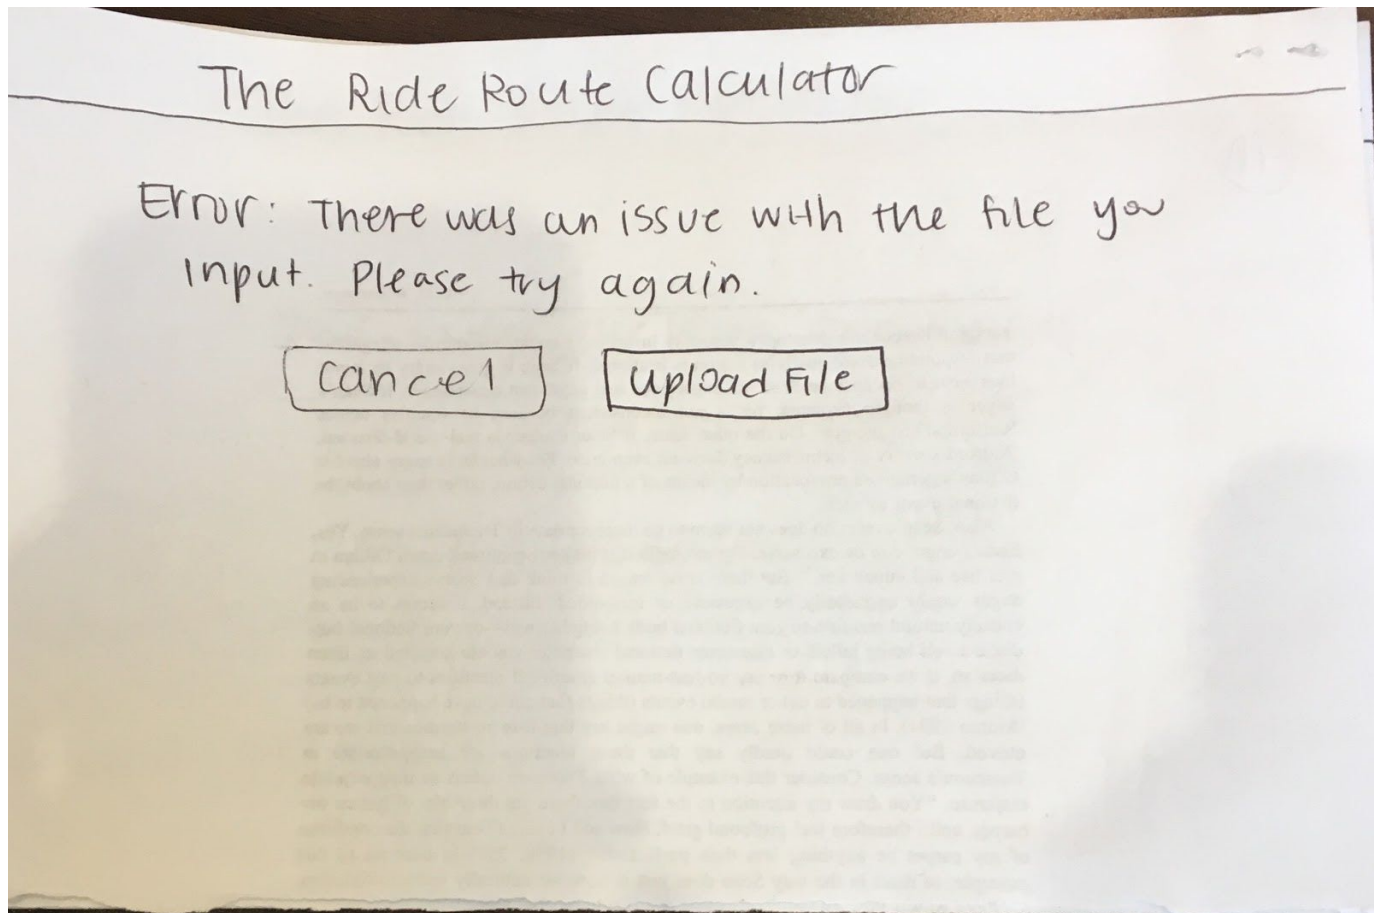

2.

A pop up window appears with files to choose from, so the system administrator can upload the appropriate file.

3. The system shows progress with uploading the file.

4a. The file uploaded is invalid (such as it was a photo or Word doc instead of csv file, or if the csv file had incomplete information). This page asks the user to upload another file or “cancel” the action, which will do nothing.

4b. The file upload was successful, and it outputs a list of all the routes for the day with pick up times and rider IDs.
