Notes from October 11 (Sprint 1)

This that went well this sprint:
We allocated time well
We planned ahead of the convention
4 use cases

This to consider in the future:
creating a slack channel?

This that didn't go so well
lack of information from client

This to complete this sprint
assuming we continue MBTA project: creating UML diagrams, possibly fixing UI
diagrams
Ask client about UI
Ask people about UI design and do a usability study if possible
Start development UI. set up the dev environment.
For next sprint: do UML diagrams
Once we know if we are continuing the project, figure out the tech stack, work on static
UI

this week we were graded on project description
will be tracked on git commits and merging

To do for next sprint:
Create a usability study about UI - refine UI based on this study
Continue to take notes and ask question when meeting with the client

Question: our use cases use an admin. What is the difference between an admin and an
end character.
